Load data

Recommended loads

Fastener designation	Shank diameter d_s [mm]	M_{rec} [Nm]
X-M6/W6	3.7	5.0
X-M8, M10	4.5	9.0
W10	5.2	14.0

X-M6/W6, X-M8, M10, W10

$N_{rec} = V_{rec} =$ 0.4 kN for $h_{ET} \geq 27$ mm

$N_{rec} = V_{rec} =$ 0.3 kN for $h_{ET} \geq 22$ mm

$N_{rec} = V_{rec} =$ 0.2 kN for $h_{ET} \geq 18$ mm

Arrangements to prevent moment on shank:

Coupler tight against concrete

Non-symmetric arrangement:

- Moment on fastened part
- Prying effect must be considered in determining loads acting on fastener

Conditions

- Minimum 5 fastenings per fastened unit (normal weight concrete)
- All visible failures must be replaced.
- With lightweight concrete base material and greater loading may be possible, please contact Hilti.
- Predominantly static loading.
- Observance of all application limitations and recommendations.
- The recommended loads in the table refer to the resistance of the individual fastening and may not be the same as the loads F_N and F_V acting on the fastened part.

Note: If relevant, prying forces need to be considered in design, see example. Moment acting on fastener shank only in case of a gap between base and fastened material.

Application requirements

Thickness of base material

Concrete

$h_{\min} = 80 \text{ mm}$ ($d_{\text{nom}} = 3.7 \text{ mm}$)

$h_{\min} = 100 \text{ mm}$ ($d_{\text{nom}} \geq 4.5 \text{ mm}$)

Thickness of fastened material

Corrosion information

The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres. For further detailed information on corrosion see relevant chapter in **Direct Fastening Principles and Technique** section.
